

Joe places a block of mass m=4.0~kg onto a frictionless floor. He attaches it to two identical springs, each of force constant k=16~N/m, so that it sits motionless at equilibrium as shown. Joe pulls the block a distance d=8~cm to the left, holds it motionless, and then at t=0, he releases the block.

- a. Just after Joe releases the block, what is the force of the springs on the mass?
- b. The block begins to slide back and forth due to the springs. What is the period of motion?
- c. What is the maximum speed of the block?
- d. Write an equation for the position of the block as a function of time. Provide numerical values, with units, for all coefficients and parameters in the equation.

a)
$$\vec{F} = + kx + kx = 2kx = 2(16 \frac{N}{m})(0.08 \text{ m}) = 2.56 \text{ N} \frac{\text{fb}}{\text{right}}$$

b) $\vec{W} = \sqrt{\frac{2k}{m}} = \sqrt{\frac{2.16 \text{ N/m}}{4.0 \text{ kg}}} = 2.83 \frac{\text{rad}}{\text{5}}$

$$\vec{P} = \frac{2\pi}{10} = 2.22 \text{ 5}$$
c) $max \ PE = \frac{1}{2}kx^2 + \frac{1}{2}kx^2 = kx^2_{max} = (16 \frac{N}{m})(0.08 \text{ m})^2 = 0.102 \text{ J}$
 $max \ PE = max \ KE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ KE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = max \ ME = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2 = 0.102 \text{ J}$
 $max \ PE = \frac{1}{2}mv_{max}^2$

The graph above shows the position of a ball attached to a spring as a function of time.

- a. Write the GENERAL equation for the position of the ball as a function of time in this situation. Use symbols, without numbers.
- b. Write the SPECIFIC equation for the position of the ball as a function of time, using information shown in the graph. Include numbers with units for all parameters and constants.
- c. The force constant of the spring is k = 27 N/m. Estimate the mass of the ball; your answer doesn't need to be exact.
- d. Is this a high-Q or low-Q system? Justify your answer.

a)
$$x(t) = A \cos(\omega t + \beta) e^{-t/\gamma}$$
 $\Rightarrow cos(\omega t + \beta) e^{-t/\gamma}$

b) Easy version: $A = 6 \text{ m}$; $\beta = 0 \text{ rad}$. $e^{-t/6m} = 2.20 \text{ m}$ at $t \approx 1.65$
 $9 \text{ cycles takes } \approx 4.8 \text{ s} \Rightarrow 9 = \frac{4.85}{9 \text{ cycle}} = 0.53 \text{ s}$
 $\Rightarrow \omega = \frac{2\pi \text{ rad}}{0.53 \text{ s}} = 11.8 \text{ rad/s}$
 $\Rightarrow x(t) = (6 \text{ m}) \cos(11.8 \text{ rad/s}) + 0 \text{ rad/s}$

this gets full credit

b) Harder version: assume
$$V(t=0) = 0^{m/5}$$
 $\Rightarrow v(t) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \sin(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega t + \omega) e^{-t/t} - \frac{1}{\tau} A \cos(\omega t + \omega)$
 $\Rightarrow v(0) = -\omega A \cos(\omega$

50 low Q

Joe attaches a wooden plank of m=4.000~kg to a spring of force constant k=15.00~kg. He allows it to come to rest, then stretches it exactly $A_0=100.0~cm$ from its equilibrium position. At time t=0~s, he releases it, and it starts to oscillate up and down. However, air resistance quickly damps the motion, and at time t=10.00~s, the amplitude of motion has shrunk to just A=13.53~cm.

a. What is the natural frequency of this system?

= 0.45 m

- b. What is the resistive coefficient **b** of this system?
- c. During those ten seconds, exactly how many cycles of oscillation did the plank make? Express your answer to three decimal places.

Fred now attaches a circular motor to the spring, which exerts a small force in a periodic manner: $F = 5.000 \text{ N} * \sin(\omega_d t)$

d. If Fred sets the driving frequency to $\omega_d = 1.000 \text{ rad/s}$, what will the be the steady-state amplitude of the plank's motion?

amplitude of the plank's motion?

(a)
$$\omega_{o} = \sqrt{\frac{k}{m}} = 1.936 \frac{r_{od}}{s}$$

b) Note that in $t = 10.5$, amplitude of motion drops to $\frac{13.53}{100} = 0.135$

which is $\frac{1}{6} \cdot \frac{1}{6}$ of original. So that's two time constants

but $\tau = \frac{2m}{b} \Rightarrow b = \frac{2m}{\tau} = \frac{2(4.000 \text{ kg})}{5.0005} = 1.600 \frac{\text{kg}}{s}$

(b) $\omega = \sqrt{\frac{k}{m} - \frac{b^{2}}{4m^{2}}} = \sqrt{\frac{3.71 \cdot \frac{1}{5^{2}}}{1.926}} = 1.926 \frac{\text{rad}}{s} \Rightarrow P = \frac{2\pi}{\omega} = 3.262$

So In $10 \text{ sic}_{1} = \frac{10.5}{2000} = \frac{10.5}{3.262} = \frac{3.066}{3.262} = \frac{3.082 \cdot \text{ryd}}{1.936 \cdot \frac{10.5}{5}} = \frac{5 \cdot \text{look}}{1.936 \cdot \frac{10.5}{5}} = \frac{5 \cdot \text{look}}{1.936 \cdot \frac{10.5}{5}} = \frac{1.600 \cdot \text{look}}{1.936$

Note A = 2.59 m if use

W1 = 1,926 rad/s

b) Another way to find time constant
$$\Upsilon$$

$$A(1=0) = 100 \text{ cm} = A e^{-0/\Upsilon}$$

$$A_0(t=0) = 100 \text{ cm} = A_0 e^{-0/\gamma}$$

 $A_1(t=10) = 13.53 \text{ cm} = A_0 e^{-10/\gamma}$

Divide the two amplitudes

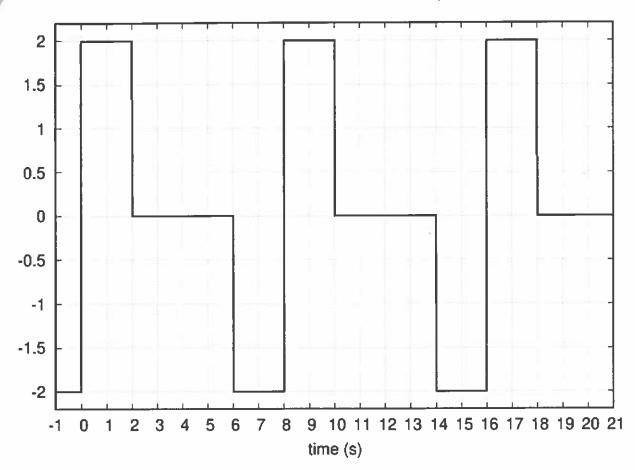

$$\frac{A_1}{A_0} = \frac{13.53 \text{ cm}}{100 \text{ cm}} = \frac{A_0 e^{-10/2}}{A_0 e^{-0/2}} = e^{-10/2}$$

$$= \frac{10}{2} = 0.1353$$

$$\ln \left(e^{-10/2} \right) = \ln \left(0.1353 \right)$$

$$= 10/2 = \ln \left(0.1353 \right)$$

$$\gamma = -\frac{10}{\ln(0.1353)} = -\frac{10}{-2} = 5$$

The graph above shows a periodic function of time.

a. What is the period of this function?

b. Write an equation which could be used to compute the Fourier coefficient A_0 . Do not evaluate the equation yet.

c. Evaluate the equation to compute the value of $\mathbf{A_0}$.

d. Write an equation which could be used to compute the Fourier coefficient A_1 . Do not evaluate the equation yet.

e. Evaluate the equation to compute the value of A_1 .

$$\begin{array}{l} (2) \quad P = 85 \\ (2) \quad A_0 = \frac{1}{2} \int_0^2 f(t) dt \\ (2) \quad A_0 = \frac{1}{8} \int_0^2 2 dt + \frac{1}{8} \int_0^6 -2 dt = \frac{1}{2} + 0 - \frac{1}{2} = 0 \\ (2) \quad A_1 = \frac{2}{2} \int_0^2 f(t) \cos(\frac{2\pi}{2}t) dt \\ (2) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (2) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (3) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_2 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_1 = \frac{2}{8} \int_0^2 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_2 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_3 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_3 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_3 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + 0 + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 2 \cos(\frac{\pi}{4}t) dt + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt + \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt \\ (4) \quad A_4 = \frac{2}{8} \int_0^8 (-2) \cos(\frac{\pi}{4}t) dt + \frac{2$$

$$A_1 = \frac{2}{\pi} \left[1 - 0 \right] - \frac{2}{\pi} \left[0 - (-1) \right]$$

$$= \frac{2}{\pi} - \frac{2}{\pi} = 0$$
